Flowhead Cleaning Instructions

Applicable to devices using Vitalograph Number 4 Fleisch Flowhead part number 61030

Including antecedent versions of the Pneumotrac, ALPHA, ALPHA Touch, COMPACT.

Hygiene Policy

Vitalograph spirometers are not designed to be, nor supplied as, sterile.

Vitalograph intends that a new Bacterial Viral Filter (BVF) be used for every subject to prevent cross contamination. Using a BVF provides a significant level of protection of the subject, the device and the user against cross contamination during spirometry manoeuvres.

The interior of a Vitalograph flowhead does not require decontamination where a new BVF is used for each subject. When used according to Vitalograph recommendations, Vitalograph spirometers are considered non-critical or low risk with regard to infection control. The exterior of the flowhead may be cleaned in line with local requirements for hand held objects.

If a higher level of decontamination is required, then cleaning may be followed by disinfection as outlined below.

Cleaning the Flowhead Exterior

Recommended cleaning method where a new BVF is used for every subject:

1. Disconnect both ends of flowhead connection tubing from pressure tapping.
2. Use a 70% isopropyl alcohol impregnated cloth to clean the case exterior of the flowhead and the flowhead connection tubing.
3. Reassemble by reconnecting the flowhead connection tubing to pressure tappings on flowhead carrier and flowhead.
4. Vitalograph recommends that calibration verification be carried out following reassembly to verify correct operation and accuracy. Instructions for calibration verification are contained in the device instructions for use.

---

Decontamination by Cleaning and Disinfection

This is the recommended cleaning method where the user suspects that the flowhead interior may have become contaminated or if a user’s local requirements for handheld items includes disinfection.

Cleaning of Flowhead Interior

1. Disconnect the flowhead connection tubing from the flowhead and flowhead carrier.

Disassemble the Fleisch flowhead:

2. Remove cone and end cap from flowhead.

3. Remove flow conditioning meshes from inside the cone and end cap. Examine for damage or contamination. If meshes are damaged or blocked, discard and replace with new parts.

4. Remove flowhead body from Fleisch element. To do this, place the Fleisch element on a hard, flat surface with the largest diameter at the top (this is the end with an ‘O’ ring showing). Push down on the flowhead body with thumbs and forefingers until it reaches the flat surface. A final pulling and twisting action will separate the parts.

5. **Cleaning.** Swill Fleisch element vigorously in warm soapy water. Do not attempt to “rub” or “scrub” at the capillaries formed by the coil.

6. Wash the flowhead end cap, flowhead body, flow conditioning meshes and flowhead cone in warm soapy water. Rub surfaces to remove any visible soiling.

7. Ensure all parts are visibly clean. If not visibly clean repeat the cleaning process.

8. Rinse with potable tap water.

If disinfection is required, proceed to disinfection steps after rinsing, otherwise proceed straight to drying.
Disinfection

1. Prepare disinfectant solution as per the disinfectant manufacturer’s recommendation.

Always follow the safety guidelines given by the manufacturer of the disinfectant chemicals.

2. Disinfect Fleisch element, flowhead end cap, flowhead body, flow conditioning meshes and flowhead cone by immersion in the solution. Ensure Fleisch element and flowhead body are immersed vertically and tap to remove air bubbles from interiors. Flush all surfaces to remove air bubbles. Soak parts for the time period recommended by the disinfectant manufacturer.

3. Rinse with potable tap water.

Drying

1. Tap the Fleisch element gently several times with the capillaries formed by the coil orientated vertically to remove excess water.

2. Arrange disassembled parts separately so that any remaining water can drain and air can circulate, e.g. on a drying rack. Drying the Fleisch element may require leaving it in a warm place overnight. If available, a drying cabinet is ideal.

3. Leave to dry completely before reassembling.

Reassembly of Fleisch Flowhead

1. Examine Fleisch element and flowhead body to ensure that no liquid or particles remain in the holes or grooves.

2. Check ‘O’ rings for damage and ensure correct positioning within the grooves.

3. Apply a very small amount of silicone grease to ‘O’ Rings and inside the surfaces of the flowhead body. Wipe off any visible amounts of grease. Ensure that the tiny annular holes on the outside of the Fleisch element are not blocked.

4. Refer to Figure 2: Flowhead Assembly to view placement of parts for reassembly.

5. Replace flowhead body onto Fleisch element. Ensure the pressure tapping on the flowhead body is nearest to the largest diameter (rear) of the Fleisch element.

6. Ensure that flowhead body is pushed fully home, and rotate it so that the port pressure tappings are approximately 180° opposite the end of the Fleisch element coil.

7. Fit flow conditioning meshes to both flowhead cone and flowhead end cap.

8. Push flowhead end cap onto the larger diameter of the Fleisch element and push flowhead cone onto the smaller diameter.

9. Reconnect flowhead tubing.

Vitalograph recommends that calibration verification be carried out following reassembly to verify correct operation and accuracy. Instructions for calibration verification are contained in the device instructions for use.
